Introduction to the Theory of Computation

Lecture 26: Mapping reducibility

Tiago Cogumbreiro

How to write a 21st century proof

Leslie Lamport

A method of writing proofs is described that makes it harder to prove things that are not true. The method, based on hierarchical structuring, is simple and practical. The author's twenty years of experience writing such proofs is discussed.

Source: lamport.azurewebsites.net/pubs/proof.pdf

Why should we read this?

- Structured proofs are just a method of displaying your proofs in a brief, yet rigorous way
- I will be doing structured proofs in this lesson, you can use this method of presenting proofs in the test!

Today we will learn...

- Computable functions
- Mapping reducible
- Mapping reducibility and decidability/undecidability
- Mapping reducibility and Turing recognition/unrecognition

Section 5.3.

If A is regular, then X_A decidable.

$$X_A = \{\langle D \rangle \mid D ext{ is a DFA} \wedge L(D) \cap A
eq \emptyset \}$$

Proof. If A is regular, then let C be the DFA that recognizes A. Let intersect be the implementation of \cap and E_DFA the decider of E_{DFA} . The following is the decider of X_A .

```
def X_A(D):
   return not E_DFA(intersect(C, D))
```

We reduced the problem of checking if X_A is decidable in terms of checking if E_{DFA} .

Can we generalize this process?

If A is regular, then X_A decidable.

$$X_A = \{ \langle D \rangle \mid D \text{ is a DFA} \land L(D) \cap A \neq \emptyset \}$$

Proof (2nd try).

1. Let $L_1(D) = L(D) \cap A$ where D is a DFA.

If A is regular, then X_A decidable.

$$X_A = \{\langle D \rangle \mid D ext{ is a DFA} \wedge L(D) \cap A
eq \emptyset \}$$

- 1. Let $L_1(D) = L(D) \cap A$ where D is a DFA.
- 2. For any D we have that $L_1(D)$ is regular. (Proof?)

If A is regular, then X_A decidable.

$$X_A = \{\langle D \rangle \mid D \text{ is a DFA} \land L(D) \cap A \neq \emptyset\}$$

- 1. Let $L_1(D) = L(D) \cap A$ where D is a DFA.
- 2. For any D we have that $L_1(D)$ is regular. (Proof?)
- 3. Let D_{DA} be the DFA that recognizes $L_1(D)$. (Proof?)

If A is regular, then X_A decidable.

$$X_A = \{\langle D
angle \mid D ext{ is a DFA} \wedge L(D) \cap A
eq \emptyset \}$$

- 1. Let $L_1(D) = L(D) \cap A$ where D is a DFA.
- 2. For any D we have that $L_1(D)$ is regular. (Proof?)
- 3. Let D_{DA} be the DFA that recognizes $L_1(D)$. (Proof?)
- 4. $\langle D
 angle \in X_A$ iff $\langle L_1(D)
 angle \in \overline{E}_{\mathrm{DFA}}$ (Proof?) †

If A is regular, then X_A decidable.

$$X_A = \{\langle D \rangle \mid D \text{ is a DFA} \land L(D) \cap A \neq \emptyset\}$$

- 1. Let $L_1(D) = L(D) \cap A$ where D is a DFA.
- 2. For any D we have that $L_1(D)$ is regular. (Proof?)
- 3. Let D_{DA} be the DFA that recognizes $L_1(D)$. (Proof?)
- 4. $\langle D
 angle \in X_A$ iff $\langle L_1(D)
 angle \in \overline{E}_{\mathrm{DFA}}$ (Proof?) †
- 5. The test $\langle L_1(D) \rangle \in \overline{E}_{\mathrm{DFA}}$ is decidable, and equivalent to testing $\langle D \rangle \in X_A$, so the latter is decidable?

 $[\]dagger$: Recall that if A decidable, then \overline{A} decidable (Lesson 21).

Mapping reducibility

Intuition

If we can establish an equivalence up to some function, then we can *reduce* a problem into another known problem solved in another language.

Example

- 4. (Mapping-reducibility): $\langle D
 angle \in X_A$ iff $\langle L_1(D)
 angle \in \overline{E}_{\mathrm{DFA}}$
- 5. (Decidability): The test $\langle L_1(D) \rangle \in \overline{E}_{DFA}$ is decidable, and equivalent to testing $\langle D \rangle \in X_A$, so the latter is decidable?

We will now implement a framework on reducibility

Mapping reducibility

Computable function

Definition 5.17

We say that

$$f:\Sigma^{\star}\longrightarrow\Sigma^{\star}$$

is a **computable** function if there exists a Turing Machine M that when given w halts and results in f(w) on its tape.

Intuition

This is a total function (terminates for all inputs) encoded in terms of a Turing Machine.

Mapping reducible

Definition 5.20

Language A is **mapping reducible** to language B, notation $A \leq_{\mathrm{m}} B$ if there is a computable function f, where for every w,

$$w \in A \iff f(w) \in B$$

What can we do with mapping reducible?

ullet Convert membership testing in A into membership testing in B

Example

$$X_A = \{\langle D
angle \mid D ext{ is a DFA} \wedge L(D) \cap A
eq \emptyset \}$$
 $E_{ ext{DFA}} = \{\langle D
angle \mid D ext{ is a DFA} \wedge L(D) = \emptyset \}$

We show that $X_A \leq_{\mathrm{m}} \overline{E}_{\mathrm{DFA}}$.

- 1. Given a DFA D let $L_1(D)$ be the DFA that recognizes $L(D) \cap A$, where A is regular.
- 2. We show that $X_A \leq_{\mathrm{m}} \overline{E}_{\mathrm{DFA}}$

Example

$$X_A = \{\langle D
angle \mid D ext{ is a DFA} \wedge L(D) \cap A
eq \emptyset \}$$
 $E_{ ext{DFA}} = \{\langle D
angle \mid D ext{ is a DFA} \wedge L(D) = \emptyset \}$

We show that $X_A \leq_{\mathrm{m}} \overline{E}_{\mathrm{DFA}}$.

- 1. Given a DFA D let $L_1(D)$ be the DFA that recognizes $L(D) \cap A$, where A is regular.
- 2. We show that $X_A \leq_{\mathrm{m}} \overline{E}_{\mathrm{DFA}}$
 - \circ Show: If $\langle D
 angle \in X_A$, then $\langle L_1(D)
 angle \in \overline{E}_{\mathrm{DFA}}$.
 - 1. $L(D) \cap A \neq \emptyset$ (assumption)
 - 2. $\langle L_1(D)
 angle \in \overline{E}_{
 m DFA}$ (by 2.1)
 - \circ Show: If $\langle L_1(D)
 angle \in \overline{E}_{\mathrm{DFA}}$, then $\langle D
 angle \in X_A$.
 - 1. $\langle D
 angle \in X_A$ by $L_1(D)
 eq \emptyset$ (assumption)

Ungraded homework exercises

- 1. Show that \leq_m is a reflexive relation.
- 2. Show that $\leq_{\rm m}$ is a transitive relation.

If A is regular, then X_A decidable.

Proof (2nd try).

- 1. Let $L_1(D) = L(D) \cap A$ where D is a DFA.
- 2. For any D we have that $L_1(D)$ is regular. (Proof?)
- 3. Let D be the DFA that recognizes L_1 . (Proof?)
- 4. $X_A \leq_{\mathrm{m}} \overline{E}_{\mathrm{DFA}}$ (Before: $\langle D
 angle \in X_A$ iff $\langle L_1(D)
 angle \in \overline{E}_{\mathrm{DFA}}$)
- 5. The test $\langle L_1(D) \rangle \in \overline{E}_{\mathrm{DFA}}$ is decidable, and equivalent to testing $\langle D \rangle \in X_A$, so the latter is decidable?

We will now generalize the (5) step

Theorem 5.22

If $A \leq_{\mathrm{m}} B$ and B is decidable, then A is decidable.

Proof in cogumbreiro/turing.

Completing the running example

If A regular, then $X_A=\{\langle D\rangle\mid D \text{ is a DFA} \wedge L(D)\cap A\neq\emptyset\}$ decidable. **Proof (3rd try).**

- 1. For any D we have that $L_{DA} = L(D) \cap A$ is regular, since:
 - \circ For any DFA D we have that $L(D)\cap A$ is regular, since regular langs are closed for \cap , L(D) is regular (def of reg langs), and A is regular (assumption).
- 2. $X_A \leq_{\mathrm{m}} \overline{E}_{\mathrm{DFA}}$, by Slide 9
- 3. $\overline{E}_{\mathrm{DFA}}$ is decidable, by Lemma R.4 and E_{DFA} decidable (Theorem 4.4)
- 4. X_A is decidable, by Theorem 5.22, $\overline{E}_{
 m DFA}$ is decidable, and $X_A \leq_{
 m m} \overline{E}_{
 m DFA}$ (2)

Lemma R.4 (Lesson 21). If A decidable, then \overline{A} decidable.

Corollary 5.23

If $A \leq_{\mathrm{m}} B$ and A is undecidable, then B is undecidable.

Proof.

Corollary 5.23

If $A \leq_{\mathsf{m}} B$ and A is undecidable, then B is undecidable.

Proof.

- 1. B is decidable, by contradiction.
- 2. A is decidable, by Theorem 5.22 and $A \leq_{\mathrm{m}} B$ (assumption) and B decidable (1)
- 3. We reach a contradiction: A is decidable (2) and undecidable (assumption).

```

Exercise 5.24

- $A_{\mathsf{TM}} \leq_{\mathsf{m}} HALT_{\mathsf{TM}} \mathsf{holds}^{\dagger}$.
- Show that $HALT_{\mathsf{TM}}$ is undecidable.

Exercise 5.24

- $A_{\mathsf{TM}} \leq_{\mathsf{m}} HALT_{\mathsf{TM}} \mathsf{holds}^{\dagger}$.
- Show that $HALT_{\mathsf{TM}}$ is undecidable.
- 1. Apply Corollary 5.23 since $A_{\rm TM}$ is undecidable (Theorem 4.11) and $A_{\rm TM} \leq_{\rm m} HALT_{\rm TM}$ (hypothesis).

[†] Proof in cogumbreiro/turing.

Theorem 5.28

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Exercise

• $A_{\mathsf{TM}} \leq_{\mathrm{m}} HALT_{\mathsf{TM}}$

Show that A_{TM} is recognizable via mapping reducibility.

Theorem 5.28

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Exercise

• $A_{\mathsf{TM}} \leq_{\mathrm{m}} HALT_{\mathsf{TM}}$

Show that A_{TM} is recognizable via mapping reducibility.

Proof.

- 1. Give a program that recognizes $HALT_{TM}$ (homework!)
- 2. A_{TM} , by Theorem 5.28, $A_{\text{TM}} \leq_{\text{m}} HALT_{\text{TM}}$, and (1).

Corollary 5.29

If A is unrecognizable and $A \leq_{\mathrm{m}} B$, then B is unrecognizable.

Theorem R.1

If $A \leq_{\mathrm{m}} B$, then $\overline{A} \leq_{\mathrm{m}} \overline{B}$.

Exercise

Show that $\overline{HALT}_{\mathsf{TM}}$ is unrecognizable.

Corollary 5.29

If A is unrecognizable and $A \leq_{\mathrm{m}} B$, then B is unrecognizable.

Theorem R.1

If $A \leq_{\mathrm{m}} B$, then $\overline{A} \leq_{\mathrm{m}} \overline{B}$.

Exercise

Show that $\overline{HALT}_{\mathsf{TM}}$ is unrecognizable.

Proof.

- 1. $\overline{A}_{\rm TM} \leq_{\rm m} \overline{HALT}_{\rm TM}$, by Theorem R.1 and $A_{\rm TM} \leq_{\rm m} HALT_{\rm TM}$ (exercise 5.24)
- 2. \overline{HALT}_{TM} is unrecognizable, by Corollary 5.29, $\overline{A}_{TM} \leq_{\mathrm{m}} \overline{HALT}_{TM}$ (1), and \overline{A}_{TM} is unrecognizable (Corollary 4.23)

Extra proofs

Theorem 5.22

If $A \leq_{\mathrm{m}} B$ and B is decidable, then A is decidable.

Proof.

Theorem 5.22

If $A \leq_{\mathsf{m}} B$ and B is decidable, then A is decidable.

Proof.

- 1. B is decidable, so let M_B be its decider.
- 2. Let M_A be a turing machine defined as: $M_A(w)=M_B(f(w))$ Run M_B with input f(w). If M_B accepts, M_A accepts. If M_B rejects, M_A rejects.
- 3. Correctness: Prove that $L(M_A)=A$ (next slide)
- 4. Termination: Prove that M_A halts for every input:

Theorem 5.22

If $A \leq_{\mathsf{m}} B$ and B is decidable, then A is decidable.

Proof.

- 1. B is decidable, so let M_B be its decider.
- 2. Let M_A be a turing machine defined as: $M_A(w) = M_B(f(w))$ Run M_B with input f(w). If M_B accepts, M_A accepts. If M_B rejects, M_A rejects.
- 3. Correctness: Prove that $L(M_A)=A$ (next slide)
- 4. Termination: Prove that M_A halts for every input: M_A just runs M_B , which halts for every input.

Our goal is show that there exists a Turing machine that decides A, so we must prove that it does recognize AMass (correctness) and that it decides A (termination).

20 / 3

Theorem 5.22

Proof (Continuation). Show that $L(M_A) = A$.

We do a case analysis on the result of executing ${\cal M}_A$ with input w and show that w is (not) in A .

Theorem 5.22

Proof (Continuation). Show that $L(M_A) = A$.

We do a case analysis on the result of executing ${\cal M}_A$ with input w and show that w is (not) in A .

• If M_A accepts some w we must show that $w \in A$. From M_B , we get that $f(w) \in L(B)$, thus, from Def 5.20, we have $w \in A$.

Theorem 5.22

Proof (Continuation). Show that $L(M_A) = A$.

We do a case analysis on the result of executing M_A with input w and show that w is (not) in A :

- If M_A accepts some w we must show that $w \in A$. From M_B , we get that $f(w) \in L(B)$, thus, from Def 5.20, we have $w \in A$.
- If M_A rejects some w we must show that $w \notin A$. If reject, then $f(w) \notin L(B)$, thus, from Def 5.20, we have $w \notin A$.

Example 5.24

$HALT_{\mathsf{TM}}$ is undecidable

Proof.

- 1. We show that $A_{\mathsf{TM}} \leq_{\mathsf{m}} HALT_{\mathsf{TM}}$ with f, where $f(\langle M, w \rangle) = \langle M', w \rangle$ and M' runs M(w) if M rejects, then loop, otherwise accept.
- 2. Since A_{TM} is undecidable, then $HALT_{\mathsf{TM}}$ is undecidable (Corollary 5.23).

Unfold Def 5.20:

$$\langle M,w
angle \in A_{\mathsf{TM}} \iff f(\langle M,w
angle) \in HALT_{\mathsf{TM}}$$

Example 5.24

$HALT_{\mathsf{TM}}$ is undecidable

Proof.

- 1. We show that $A_{\mathsf{TM}} \leq_{\mathsf{m}} HALT_{\mathsf{TM}}$ with f, where $f(\langle M, w \rangle) = \langle M', w \rangle$ and M' runs M(w) if M rejects, then loop, otherwise accept.
- 2. Since A_{TM} is undecidable, then $HALT_{\mathsf{TM}}$ is undecidable (Corollary 5.23).

Unfold Def 5.20:

$$\langle M,w
angle \in A_{\mathsf{TM}} \iff f(\langle M,w
angle) \in HALT_{\mathsf{TM}}$$

Step 1: $\langle M,w
angle \in A_{\mathsf{TM}} \implies f(\langle M,w
angle) \in HALT_{\mathsf{TM}}$

Step 2: $f(\langle M,w \rangle) \in HALT_{\mathsf{TM}} \implies \langle M,w \rangle \in A_{\mathsf{TM}}$

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

$$HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$$

and that M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 1.
$$\langle M,w \rangle \in A_{\mathsf{TM}} \implies f(\langle M,w \rangle) \in HALT_{\mathsf{TM}}.$$

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

$$HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$$

and that M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 1.
$$\langle M,w
angle \in A_{\mathsf{TM}} \implies f(\langle M,w
angle) \in HALT_{\mathsf{TM}}.$$

ullet Since $\langle M,w
angle \in A_{\mathsf{TM}}$, then M accepts w.

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

$$HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$$

and that M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 1. $\langle M,w
angle \in A_{\mathsf{TM}} \implies f(\langle M,w
angle) \in HALT_{\mathsf{TM}}.$

- ullet Since $\langle M,w
 angle \in A_{\mathsf{TM}}$, then M accepts w.
- ullet Thus, M' halts, and therefore $\langle M',w
 angle \in HALT_{\mathsf{TM}}$

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

- 1. $HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$
- 2. M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 2. We have $f(\langle M,w\rangle)=\langle M',w\rangle\in HALT_{\mathsf{TM}}$ and must show $\langle M,w\rangle\in A_{\mathsf{TM}}$.

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

- 1. $HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$
- 2. M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 2. We have $f(\langle M,w\rangle)=\langle M',w\rangle\in HALT_{\mathsf{TM}}$ and must show $\langle M,w\rangle\in A_{\mathsf{TM}}$.

• Since $f(\langle M,w \rangle) \in HALT_{\mathsf{TM}}$ and (1), then M' halts.

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

- 1. $HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$
- 2. M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 2. We have $f(\langle M,w\rangle)=\langle M',w\rangle\in HALT_{\mathsf{TM}}$ and must show $\langle M,w\rangle\in A_{\mathsf{TM}}$.

- Since $f(\langle M,w
 angle) \in HALT_{\mathsf{TM}}$ and (1), then M' halts.
- Thus, M' accepts,

$HALT_{\mathsf{TM}}$ is undecidable

Recall that:

- 1. $HALT_{\mathsf{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ halts on input } w \}$
- 2. M' runs M(w) if M reject, then loop, otherwise accept.

Proof (continuation).

Step 2. We have $f(\langle M,w\rangle)=\langle M',w\rangle\in HALT_{\mathsf{TM}}$ and must show $\langle M,w\rangle\in A_{\mathsf{TM}}$.

- Since $f(\langle M,w \rangle) \in HALT_{\mathsf{TM}}$ and (1), then M' halts.
- Thus, M' accepts, and since M' only accepts when M accepts w, we conclude our proof.

If $A \leq_{\mathsf{m}} B$ and B is recognizable, then A is recognizable.

Detailed proof.

We must show that there exists some M_A that recognizes A.

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Detailed proof.

We must show that there exists some M_A that recognizes A.

- 1. Let $M_A(w)=M_B(f(w))$. That is, machine M_A given w computes f(w) and accepts.
- 2. Show that $L(M_A) = A$.
 - \circ **Step 1:** If M_A accepts w, then $w \in A$.
 - \circ **Step 2:** If $w \in A$, then M_A accepts w.

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Proof (Step 1).

	Hypothesis
H1	M_A accepts w
H2	$w \in A \iff f(w) \in B$
НЗ	M_B recognizes B
H4	$M_A(w)=M_B(f(w))$

Goal: show that $w \in A$

1. Since (H1) M_A accept w and H4, we have that M_B accepts f(w).

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Proof (Step 1).

	Hypothesis
H1	M_A accepts w
H2	$w \in A \iff f(w) \in B$
НЗ	M_B recognizes B
H4	$M_A(w)=M_B(f(w))$

Goal: show that $w \in A$

- 1. Since (H1) M_A accept w and H4, we have that M_B accepts f(w).
- 2. From M_B accepts f(w) and H3, we get $f(w) \in B$.

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Proof (Step 1).

	Hypothesis
H1	M_A accepts w
H2	$w \in A \iff f(w) \in B$
НЗ	M_B recognizes B
H4	$M_A(w)=M_B(f(w))$

Goal: show that $w \in A$

- 1. Since (H1) M_A accept w and H4, we have that M_B accepts f(w).
- 2. From M_B accepts f(w) and H3, we get $f(w) \in B$.
- 3. Since $f(w) \in B$ and H2, then $w \in A$.

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Proof. (Step 2)

	Hypothesis
H0	$w \in A$
H1	$w \in A \iff f(w) \in B$
H2	M_B recognizes B
НЗ	$M_A(w)=M_B(f(w))$

Goal: show that M_A accepts w.

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Proof. (Step 2)

	Hypothesis
H0	$w \in A$
H1	$w \in A \iff f(w) \in B$
H2	M_B recognizes B
НЗ	$M_A(w)=M_B(f(w))$

Goal: show that M_A accepts w.

- 1. From (H1) $w \in A$ and H2, we have that $f(w) \in B$.
- 2. From $f(w) \in B$ and H3, we have that M_B accepts f(w)
- 3. From M_B accepts f(w) and H4, we have that M_A accepts w.

If $A \leq_{\mathsf{m}} B$ and B is recognizable, then A is recognizable.

Detailed proof.

We must show that there exists some M_A that recognizes A.

If $A \leq_{\mathrm{m}} B$ and B is recognizable, then A is recognizable.

Detailed proof.

We must show that there exists some M_A that recognizes A.

- 1. Let $M_A(w)=M_B(f(w))$. That is, machine M_A given w computes f(w) and accepts.
- 2. Show that $L(M_A) = A$.
 - \circ **Step 1:** If M_A accepts w, then $w \in A$.
 - \circ **Step 2:** If $w \in A$, then M_A accepts w.

Homework 8

EXAMPLE 5.24

In Theorem 5.1 we used a reduction from A_{TM} to prove that $HALT_{TM}$ is undecidable. This reduction showed how a decider for $HALT_{TM}$ could be used to give a decider for A_{TM} . We can demonstrate a mapping reducibility from A_{TM} to $HALT_{TM}$ as follows. To do so, we must present a computable function f that takes input of the form $\langle M, w \rangle$ and returns output of the form $\langle M', w' \rangle$, where

$$\langle M, w \rangle \in A_{\mathsf{TM}}$$
 if and only if $\langle M', w' \rangle \in HALT_{\mathsf{TM}}$.

The following machine F computes a reduction f.

$$F =$$
 "On input $\langle M, w \rangle$:

1. Construct the following machine M'.

$$M' =$$
 "On input x :

- **1.** Run *M* on *x*.
- **2.** If M accepts, accept.
- **3.** If *M* rejects, enter a loop."
- **2.** Output $\langle M', w \rangle$."

Use Corollary 5.23.

- 1. $A_{\mathsf{TM}} \leq_{\mathsf{m}} HALT_{\mathsf{TM}}$ (next slide)
- 2. A_{TM} is undecidable by Theorem 4.11 (Lesson 21)

```
Theorem example_5_24:
    ~ Decidable HALT_tm.
Proof.
    apply reducible_undecidable with (A:=A_tm).
    - apply A_tm_red_HALT_tm.
    - apply a_tm_undecidable.
Qed.
```

The mapping function is given in the book. We separate the construction of M^\prime into its own function just so we can prove theorems more simply.

```
F = "On input \langle M, w \rangle:

1. Construct the following machine M'.

M' = "On input x:

1. Run M on x.

2. If M accepts, accept.

3. If M rejects, enter a loop."

2. Output \langle M', w \rangle."
```

```
(* Construct the following machine *)
Definition A_tm_looper M := Build (
  fun x \Rightarrow (* On input x: *)
  mlet r <- Call M x in (* 1. Run M on x
  if r then ACCEPT (* 2. If M accepts, acce
  else LOOP). (* 3. If M rejects, enter a
Definition A_tm_to_HALT_tm p:=
    (* On input < [ M, w ] > *)
    let (M, w) := decode_machine_input p in
    (* 1. Construct the following machine M
    let M' := A_tm_looper M w in
    (* 2. Output < [ M', w ] > *)
    <[ M', w ]>.
                                     Boston
```

- 1. Show that if $F(w) \in HALT_{TM}$, then $w \in A_{TM}$.
- 2. Show that if $w \in A_{TM}$, then $F(w) \in HALT_{TM}$.

```
Theorem A_tm_red_HALT_tm: A_tm <=m HALT_tm.
Proof.
   apply reducible_iff with A_tm_to_HALT_tm.
   split; intros.
   - apply A_tm_red_HALT_tm_1; auto.
   - apply A_tm_red_HALT_tm_2; auto.
Qed.</pre>
```

Structure of the proof

- 1. Simplify assumption $w \in A_{TM}$ (with inversion theorem)
 - \circ We get that $w = \langle M, i
 angle$ for some M and i
 - \circ We get that M accepts i
- 2. Show $F(\langle M,i \rangle) \in HALT_{TM}$ (with constructor _def theorem)
 - $\circ \ F(\langle M,i
 angle) = \langle looper(M),i
 angle$
 - \circ Show that looper(M) does not loop when M accepts

```
Lemma A_tm_red_HALT_tm_1:
   forall w,
   A_tm w ->
   HALT_tm (A_tm_to_HALT_tm w).
```

- 1. Simplify assumption $F(w) \in HALT_{TM}$ (by inverting with <code>_inv</code>)
 - \circ Obtain $F(w) = \langle M', i
 angle$ for some M' and i (invert)
 - ullet Obtain that $w=\langle M,i
 angle$ for some M
 - Obtain that M' = looper(M)
 - \circ Obtain that M' does not loop with i
 - ullet Thus, M accepts i
- 2. Show $w \in A_{TM}$ (construct goal using _def theorem)
 - \circ Since M accepts i and $w = \langle M, i
 angle$

```
Lemma A_tm_red_HALT_tm_2:
   forall w,
   HALT_tm (A_tm_to_HALT_tm w) ->
   A_tm w.
```
