Introduction to the Theory of Computation

Lecture 3: Induction principle

Tiago Cogumbreiro

Today we will learn...

- Rewriting tactics
- Case analysis tactics
- Induction tactics
- Induction principle

Rewriting terms

Multiple pre-conditions in a lemma

```
Theorem plus_id_example : forall n m:nat,
  n = m ->
  n + n = m + m.
Proof.
  intros n.
  intros m.
```

Multiple pre-conditions in a lemma

```
Theorem plus_id_example : forall n m:nat,
  n = m ->
  n + n = m + m.
Proof.
  intros n.
  intros m.
```

yields

```
1 subgoal
n, m : nat
______________________________________(1/1)
n = m -> n + n = m + m
```

Multiple pre-conditions in a lemma

applying `intros H` yields

```
1 subgoal
n, m : nat
H : n = m
______________________________________(1/1)
n + n = m + m
```

How do we use `H`? **New tactic:** use `rewrite -> H` (lhs becomes rhs)

```
1 subgoal
n, m : nat
H : n = m
______________________________________(1/1)
m + m = m + m
```

> How do we conclude? Can you write a `Theorem` that replicates the proof-state above?

Let us prove this example

```
Theorem plus_id_exercise : forall n m o : nat,
  n = m -> m = o -> n + m = m + o.
Proof.
```

(Done in class...)

Comparing naturals

Consider this recursive function that tests if two naturals are equal.

```
Fixpoint beq_nat (n m : nat) : bool :=
  match n with
  | O ⇒ match m with
         | O ⇒ true
         | S m' ⇒ false
         end
  | S n' ⇒ match m with
            | O ⇒ false
            | S m' ⇒ beq_nat n' m'
            end
  end.
```

How do we prove this example?

```
Theorem plus_1_neq_0_firsttry : forall n : nat,
  beq_nat (plus n 1) 0 = false.
Proof.
  intros n.
```

yields

```
1 subgoal
n : nat
______________________________________(1/1)
beq_nat (plus n 1) 0 = false
```

How do we prove this example?

```
Theorem plus_1_neq_0_firsttry : forall n : nat,
  beq_nat (plus n 1) 0 = false.
Proof.
  intros n.
```

yields

```
1 subgoal
n : nat
______________________________________(1/1)
beq_nat (plus n 1) 0 = false
```

Apply `simpl` and it does nothing. Apply `reflexivity`:

```
In environment
n : nat
Unable to unify "false" with "beq_nat (plus n 1) 0".
```

Why does simpl fail?

Q: Why can't `beq_nat (n + 1)` be simplified? (Hint: inspect its definition.)

Why does simpl fail?

Q: Why can't `beq_nat (n + 1)` be simplified? (Hint: inspect its definition.)

A: `beq_nat` expects the first parameter to be either `0` or `S ?n`, but we have an expression `n + 1` (or `plus n 1`).

Why does simpl fail?

Q: Why can't `beq_nat (n + 1)` be simplified? (Hint: inspect its definition.)

A: `beq_nat` expects the first parameter to be either `0` or `S ?n`, but we have an expression `n + 1` (or `plus n 1`).

Q: Can we simplify `plus n 1`?

Why does simpl fail?

Q: Why can't `beq_nat (n + 1)` be simplified? (Hint: inspect its definition.)

A: `beq_nat` expects the first parameter to be either `0` or `S ?n`, but we have an expression `n + 1` (or `plus n 1`).

Q: Can we simplify `plus n 1`?

A: No because `plus` decreases on the first parameter, not on the second!

Case analysis

Case analysis (1/3)

Let us try to inspect value `n`. Use: `destruct n as [| n'].`

```
2 subgoals
______________________________________(1/2)
beq_nat (0 + 1) 0 = false
______________________________________(2/2)
beq_nat (S n' + 1) 0 = false
```

Now we have two goals to prove!

```
1 subgoal
______________________________________(1/1)
beq_nat (0 + 1) 0 = false
```

How do we prove this?

Case analysis (2/3)

After we conclude the first goal we get:

```
This subproof is complete, but there are some unfocused goals:

______________________________________(1/1)
beq_nat (S n' + 1) 0 = false
```

Use another bullet (`-`).

```
1 subgoal
n' : nat
______________________________________(1/1)
beq_nat (S n' + 1) 0 = false
```

And prove the goal above as well.

> Why can the latter be simplified?

Case analysis (3/3)

- Use: `destruct n as [| n']` when you want to explicitly name the variables being introduced
- Otherwise, use: `destruct n` and let Coq automatically name the variables.

> Using automatically generated variable names makes the proofs more brittle to change.

Example: prove this lemma (1/4)

```
Theorem plus_n_O : forall n:nat,
  n = n + 0.
Proof.
```

Example: prove this lemma (1/4)

```
Theorem plus_n_O : forall n:nat,
  n = n + 0.
Proof.
```

Tactic `simpl` does nothing.

Example: prove this lemma (1/4)

```
Theorem plus_n_O : forall n:nat,
  n = n + 0.
Proof.
```

Tactic `simpl` does nothing. Tactic `reflxivity` fails.

Example: prove this lemma (1/4)

```
Theorem plus_n_O : forall n:nat,
  n = n + 0.
Proof.
```

Tactic `simpl` does nothing. Tactic `reflxivity` fails. Apply `destruct n`.

```
2 subgoals
______________________________________(1/2)
0 = 0 + 0
______________________________________(2/2)
S n = S n + 0
```

Example: prove this lemma (2/4)

After proving the first, we get

```
1 subgoal
n : nat
______________________________________(1/1)
S n = S n + 0
```

Applying `simpl` yields:

```
1 subgoal
n : nat
______________________________________(1/1)
S n = S (n + 0)
```

Example: prove this lemma (2/4)

After proving the first, we get

```
1 subgoal
n : nat
________________________________________(1/1)
S n = S n + 0
```

Applying `simpl` yields:

```
1 subgoal
n : nat
________________________________________(1/1)
S n = S (n + 0)
```

Tactic `reflexivity` fails and there is nothing to rewrite.

We need an induction principle of `nat`

For some property `P` we want to prove.

- Show that $P(0)$ holds.
- Given the induction hypothesis $P(n)$, show that $P(n+1)$ holds.

Conclude that $P(n)$ holds for all n.

Example: prove this lemma (3/4)

Apply `induction n`.

```
2 subgoals
______________________________________(1/2)
0 = 0 + 0
______________________________________(2/2)
S n = S n + 0
```

> How do we prove the first goal?
> Compare `induction n` with `destruct n`.

Example: prove this lemma (4/4)

After proving the first goal we get

```
1 subgoal
n : nat
IHn : n = n + 0
______________________________________(1/1)
S n = S n + 0
```

applying `simpl` yields

```
1 subgoal
n : nat
IHn : n = n + 0
______________________________________(1/1)
S n = S (n + 0)
```

> How do we conclude this proof?

Intermediary results

```
Theorem mult_0_plus' : forall n m : nat,
  (0 + n) * m = n * m.
Proof.
  intros n m.
  assert (H: 0 + n = n). { reflexivity. }
  rewrite -> H.
  reflexivity. Qed.
```

- `H` is a variable name, you can pick whichever you like.
- Your intermediary result will capture all of the existing hypothesis.
- It may include `forall`.
- We use braces `{` and `}` to prove a sub-goal.
