Structure of Higher Level Languages

Lecture 1: Course info, arithmetic in Racket

Tiago Cogumbreiro

About the course

- **Instructor:** Tiago (蒂亚戈) Cogumbreiro
- **Classes:** Tuesday & Thursday
5:30pm to 6:45pm at M-1-0207, McCormack
- **Office hours:** Tuesday & Thursday
4:00pm to 5:30pm at S-3-183, Science Center
- **Course web page:** piazza.com/umb/spring2019/cs450/

Homework submission page

Please, take time to register on Gradescope, so that you can submit your homework assignments.

- Homework submission page: www.gradescope.com/courses/37850
- Your entry code is **MR7WPD**.
- Please, **register using your UMB email address**, otherwise you won't be able to submit your first homework.
- Homework 1 is due February 12 at 5:30pm and your homework assignment sheet must be **picked up in person**, as each student has a unique assignment. Please, contact me if you cannot pick up your homework assignment page in class.
- When uploading to Gradescope, please ensure the filename is `main.rkt`, otherwise your assignment will get 0 points.

This course is ...

- **on algorithms**

For a nice free book read Algorithms by Jeff Erickson.

- **an introduction on programming and computing**

For a nice free book read How to design programs by Matthias Felleisen, Robert Bruce Findler, Matthew Flatt, Shriram Krishnamurthi

- **on programming with Racket**

For a nice free book read The Racket Guide by Matthew Flatt, Robert Bruce Findler, and PLT

This course is...

- **on designing programming language features**
We will focus mainly on functional and object-oriented programming.
- **on semi-formal specification**
We will drive our course with precise mathematical notations and tests.
- **on programming patterns**
We will characterize patterns and study abstractions of these patterns.
- **on purely functional programming**
We will approach programming without using assignment (mutation).

Today we will learn

- a formalism to describe a programming language (Racket)
- the semantics of a programming language

How we will learn it

We introduce one language feature at a time

1. **Syntax:** We formalize each language feature (What)
2. **Example:** We illustrate a feature with an example
3. **Semantics:** We introduce how each language feature works (How)

Semantics

- Abstract *Syntax*: how we write something. Example, which characters/string we use write a keyword, or a number.
- *Semantics*: what that something does/means (evaluation here means as the program runs)

In this class, we focus on the **semantics** of programming languages. We define the semantics of some programming language features.

1. We shall print to output!

Instead, we will use `print`.

2. We shall mutate variables!

Instead, we will use `set!`.

3. We shall use loops!

Instead, we will use `loop`.

Program

In Racket, **everything evaluates down to or is a value**. A Racket program consists of a preamble followed by zero or more expressions:

```
program = #lang racket expression*
```

1. Racket has no end-of-line delimiters (contrary to, say, C-like languages which use semi-colons)
2. Racket evaluates each expression from top-to-bottom, left-to-right

■ For space-constraint reasons, code listings might omit the preamble.

Language specification

- **Grayed out text** represents the concrete syntax
- *Italic text* represents a meta-variable

Expressions

Expressions can be values, among other things

```
expression = value | ...
```

Values

- **Numbers**
- Void
- Booleans
- Lists
- ...

Numbers

Numbers

All numbers are complex numbers. Some of them are real numbers, and all of the real numbers that can be represented are also rational numbers, except for `+inf.0` (positive infinity), `+inf.f` (single-precision variant), `-inf.0` (negative infinity), `-inf.f` (single-precision variant), `+nan.0` (not-a-number), and `+nan.f` (single-precision variant). Among the rational numbers, some are integers, because `round` applied to the number produces the same number.

Source: [Racket Manual, Section 4.2](#)

Hello, Numbers!

Your first Racket program

```
#lang racket
10      ; A positive number
+10     ; The plus sign is optional
-10     ; A negative number
0+1i    ; A complex number
1/3     ; A rational number
0.33    ; A floating-point number
```

```
$ racket nums.rkt
10
10
-10
0+1i
1/3
0.33
```

Note: a semi-colon (;) initiates a comment section, which is ignored in Racket. A semi-colon is **not** an end-of-line marker, like in C-like languages.

Expressions are separated by white-space

These two programs are equal:

```
#lang racket
10
+10
-10
0+1i
1/3
0.33
```

```
#lang racket
10 +10 -10      0+1i 1/3 0.33
```

Caveats: `-1` is different than `- 1` (notice the white space in between both characters). The former is the negative one, the latter is the expression `-` and the value `1`. Similarly, `1/3` is a single rational number, whereas `1 / 3` are three expressions.

Function calls

Function call

Delimited by parenthesis and its constituents are separated by white-space characters. The first expression must evaluate to a function, the remaining expressions are the arguments. Each expression is evaluated to a value from left-to-right before applying the function.

```
expression = value | variable | function-call | ...
function-call = ( expression-func expression-arg* )
```

For instance, function call `(expt 2 3)`, for exponentiation, returns 2 raised to the power of 3. Function `sin` computes the sine function of its sole argument.

```
#lang racket
(expt 2 3)
(sin (expt 2 3))
```

```
$ racket nums-func.rkt
8
0.1411200080598672
```

Note: Function calls can be compounded, as the parameters of a function are arguments too.

No infix notation in Racket

There is **NO INFIX NOTATION** for arithmetic operations (unlike most languages).

The usual arithmetic operations are all just variables: addition `+`, subtraction `-`, multiplication `*`, division `/`.

Example:

```
( * 3.14159 ( * 10 10))
| | |      | | | |→ Number
| | |      | | | |→ Number
| | |      | | | |→ Variable
| | |      | | | |→ Function call
| | |→ Number
| |→ Variable
|→ Function call
```

Note: In Racket parenthesis represent function application. Contrasted with most C-like languages where parenthesis in expressions are optional and only there to help the reader.

Evaluating a function call

Evaluating a function call

Evaluation works from left-to-right from top-to-bottom

```

#racket lang
; Version 1:
(* 3.14159 (* 10 10))
; Version 2:
(* 3.14159 100)
;      ^^^- Evaluated (* 10 10)
; Version 3:
314.159
;^^^^^^- Evaluated (* 3.14159 * 100)
  
```

Arithmetic expressions example

```
(+
  (+
    (* 11 15)
    (+ 14 4))
  (-
    (/ 3 9)
    (* 14 3)))
```

$$((11 \cdot 15) + (14 + 4)) + \left(\frac{3}{9} - (14 \cdot 3)\right)$$

A longer example

```
(+
  (+
    (* 11 15)
    (+ 14 4))
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  (+
    165
    (+ 14 4))
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  (+
    165
    18)
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  183
  (-
    (/ 3 9)
    (* 14 3)))
```

A longer example

```
(+
  (+
    (* 11 15)
    (+ 14 4))
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  (+
    165
    (+ 14 4))
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  (+
    165
    18)
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  183
  (-
    (/ 3 9)
    (* 14 3)))
```

```
(+
  183
  (-
    1/3
    (* 14 3)))
```

```
(+
  183
  (-
    1/3
    42))
```

```
(+
  183
  -125/3)
```

424/3

Is this example a legal Racket program?

```
#lang racket  
sin
```

Is this example a legal Racket program?

```
#lang racket  
sin
```

Yes! `sin` is a variable, so a valid expression. Hence, Racket just prints what is in variable `sin`.

```
$ racket sin.rkt  
#<procedure:sin>
```

■ **Note:** In Racket lingo the word *procedure* is a synonym for function.

Racket specification

```
program = #lang racket expression*  
expression = value | variable | function-call | ...  
value = number | ...  
function-call = ( expression+ )
```
